Prescriptive Ventilation TM Prescriptive Ventilation

Prescriptive Ventilation can halt the spread of a rot area and protect your bottom line.

Manage your storage moisture balance and challenge areas through the use of Techmark's innovative Prescriptive Ventilation. Prescriptive Ventilation allows you to target an area of breakdown and move dry air through the pile to a specific section while allowing normal ventilation to the rest of the pile.

Prescriptive Ventilation is *"an air system within an air system"*. Manage your pile separately from areas of breakdown. For more information visit our website or contact Techmark.

Techmark, Inc.

technology from the ground up

Prescriptive Ventilation provides High Airflow / Low RH air from the secondary system to a target location of breakdown in the pile. All while maintaining normal airflow to the rest of the pile.

Prescriptive Ventilation can also be configured as a mobile unit. In this example, we outfitted a trailer system allowing the air system to be portable between buildings. This flexibility in design and application is why Prescriptive Ventilation can be so effective at meeting storage challenges and preventing total bin loss.
